10 December 1984

PERSONAL MONITOR RECORDS FROM EXTERNAL EXPOSURE
TO BETA AND GAMMA RADIATION DURING ENGAGEMENT IN THE PROGRAM
OF BRITISH NUCLEAR WEAPONS TESTS IN AUSTRALIA.

Tabulation of Personal Monitoring Data

The tabulation at Appendix 1 gives the data from all personal monitor records for Australians available to 10 December 1984. The tabulation covers all trials in Australia in the British nuclear weapons program.

Records

The compilation encompasses all data available in five sets of records. The entries from the records are included as reported, without editing to reconcile overlapping results and without interpretation (see below "Reconciliation and Interpretation").

1. UKAWRE SFS/OEL/AA/1(P) 29 January 1982 and Addendum No 1 30 April 1982 "Listing of persons at UK overseas defence nuclear experimental programmes, citizens of Australia". The listing includes data from currently available information related to exposure to ionizing radiations in which Australians were involved. The list is extensive, but it is not complete; entries are not present for every Australian known to have been exposed to radiation in the British nuclear weapons programs in Australia. In some instances the information available to the compilers was sparse; and it is recognised that some UK nationals may have been inadvertently included in the list, whereas some Australians may have been omitted.
2. Australian Health Physics (AHP) listing of radiation exposure at Maralinga, prepared by Department of National Development and Energy during 1981 from information in the files and monthly reports of the AHP. The listing is not complete; moreover, it overlaps substantially with SFS/OEL/AA/1(P), but some entries differ from their counterparts in SFS/OEL/AA/1(P). The AHP documents do not differentiate between Australian and other nationals and some personnel included in the listing are not Australian.
3. "Radiological health during Operation HURRICANE (Monte Bello Is, October/November 1952) and Operation TOTEM (Emu Claypan, SA, October/November 1953)" minute 1 December 1953 to Director General Medical Services (RAAF) from Sqn. Ldr. **s 47F - personal privacy** to the Chief of the Air Staff) with attachments listing total gamma-radiation dose to Australian service and civilian personnel during the two Operations.

4. Personal monitoring record for November/December 1952 and October 1953 maintained by **s 47F - personal privacy** and advised by him to Department of National Development and Energy, 25 March 1982.
5. Personal monitor record for W02 **s 47F - personal privacy**, previously considered to have been a UK serviceman, but identified as an Australian by UKAWRE and advised to Department of Defence, 11 May 1984.

Tabulated Entries

1. Abbreviations used for organisational groups are

AT = Aircraft	MT = Materials
BT = Biological	NM = Neutron Measurement
CACODS = Commonwealth Advisory Committee for Defence Science	OT = Ordnance
DC = Decontamination	RDU = Radiation Detection Unit
ET = Electronics	RM = Radiological Measurements
HP = Health Physics	SU = Maralinga Range Support Unit
IF = Indoctrinee Force	TS = Technical Services
IT = Target Instrumentation	X200 = Australian Services Group, EMU
ME or MS = Meteorological Services	XT = Explosives

2. Radiation doses are taken from the personal monitor record and expressed as millisievert, taking 1 millisievert as numerically the same as 100 milliroentgen

- column G is the gamma-radiation component
- column AGG is the aggregate of gamma plus beta radiation components
- localised gamma-radiation doses are given where available, with the following abbreviations for sites

LH = left hand
RH = right hand
H = head
W = wrist

Unless otherwise stated, the radiation exposures were measured by film badge.

3. No entry, "Nil" or "Below XX", given under radiation dose, indicates

- that the monitored exposure to radiation was below the minimum detectable by the method, namely, 0.2 millisievert, except for
 - . Operation MOSAIC, all personnel : 0.5 millisievert
 - . Operation BUFFALO, Indoctrinee Force : 4 millisievert
- or that the person concerned was engaged in work where personal monitoring was not performed or not needed.

4. Bracketed numbers after entries refer to personal communications or operations and have the following significance

- (1) Known to have been present at Buffalo, Antler, Kittens 1955 and worked throughout Range area.
- (2) Known to have also been at Maralinga.
- (3) Known to have been at Emu and to have travelled within the Range from 1954 onwards.
- (4) UK Operation in the Pacific Ocean.
- (5) Known to have been at Monte Bello November 1953.

- (6) The UK nuclear weapons trials at Christmas Island, Pacific Ocean.
- (7) Known to have visited Maralinga on several occasions.
- (8) Believed to have spent much time on the Ranges, 1953 to approximately 1963.
- (9) Believed to be a UK national.
- (10) Believed to be S 47F - personal privacy
- (11) The queried dose is believed to refer to a UK Senior RAF Officer of similar name.
- (12) Was also at Maralinga in 1956.
- (13) Radiation dose received on 27 October 1953 exceeded the range of personal monitor.
- (14) Known to have been at Monte Bello January 1953.

Reconciliation and Interpretation

The personal monitor records for Australians from the program of British nuclear tests are currently maintained by the Australian Radiation Laboratory. The records are incomplete and they contain inconsistencies; until these flaws are rectified, adjustment and interpretation is not being attempted for the entire set. However, the Laboratory will provide a report on the personal monitor record for an individual, on request. To the extent possible, omitted information is completed and inconsistent entries are reconciled; conversion is made to effective dose-equivalent and dose-equivalent for the conditions of the exposure to radiation. The form and content of the Laboratory's report for an individual are indicated at

- Appendix 2: personal monitor record available for gamma-radiation only
- Appendix 3: personal monitor record available for both beta and gamma radiation

Comparison can be made with radiation protection standards or with other indicators of significance to health of the radiation exposure.

1. "Radiation protection category" is required when making comparisons with radiation protection standards. It is assigned on the basis of the usual duties of members of the organisational group or working unit.
2. "Period of radiation exposure" is required when making comparisons with radiation protection standards.
3. "Effective dose-equivalent from external exposure of the whole body to gamma-radiation" is now the quantity of greatest interest because of its relevance to considerations of possible induction of cancer by radiation (stochastic effects). Derivation of the effective dose-equivalent from the personal monitor record entails the following steps

Gs millisievert, the monitor record under G in Appendix 1, is the dose-equivalent due to gamma-radiation, at body surface

$$Gs = \frac{R \times 0.869 \times 1.10 \times Q}{100}$$

$$= 9.6 \times 10^{-3} R$$

- where .
- R milliroentgen is the exposure to gamma-radiation measured by the personal monitor
 - . factor 0.869 rad per roentgen converts to absorbed dose in air for exposure to gamma-radiation, with full secondary electron equilibrium

- factor 1.10 is the ratio of mass energy absorption coefficients for tissue and air
- Q is the quality factor, taking the value 1 for beta and gamma radiation

- the effective dose-equivalent in millisievert is given by

$$G_s \times 0.75$$

$$= 7.2 \times 10^{-3} \text{ R}$$

where • factor 0.75 converts from dose-equivalent from gamma-radiation at body surface to deep organ dose-equivalent. The factor accounts for the complex of interactions with tissues overlying the organs of interest, and is taken from UNSCEAR (1977) Annex A paragraphs 36 to 44.

4. The monitored external exposure to beta-radiation is expressed in the two quantities: dose-equivalent to skin and dose-equivalent to lens of the eye. The consequences of concern are non-malignant damage to the skin and cataract of the lens, respectively (non-stochastic effects). If they occur, it is within the period shortly after the radiation exposure. Derivation of the two dose-equivalents from the personal monitor record entails the following steps

- B_s millisievert is the dose-equivalent due to beta-radiation, at body surface; it is given by the difference, $AGG - G$, between the monitor records under G and AGG in Appendix 1

- dose-equivalent to skin in millisievert is given by

$$G_s + B_s$$

it is assumed that the individual is lightly clad with no absorption of beta-radiation by clothing

- dose-equivalent to lens in millisievert is given by

$$G_s \times 0.88 + B_s \times b$$

where • factor 0.88 accounts for the reduction in gamma-radiation dose with height over the contaminated plane; the value is derived from the Effects of Nuclear Weapons (1977) page 454

- factor b takes 0.01 for 10-day old fission products
- 0.08 for 100-day old fission products
- 0.12 for 1000-day old fission products

it converts dose-equivalent due to beta-radiation at the personal monitor to dose-equivalent at the lens. The derivation of b is outlined in Appendix 4.

SUMMARY OF EFFECTIVE DOSE-EQUIVALENTS FROM EXTERNAL EXPOSURE OF THE WHOLE BODY TO GAMMA-RADIATION
RECORDED DURING ENGAGEMENT IN THE PROGRAM OF BRITISH NUCLEAR WEAPONS TESTS IN AUSTRALIA

Name:

Employer:

Operation/location:

Work Unit:

Radiation protection category (Note 1):

Period of recorded radiation exposure	Personal monitor record in millisievert (Notes 2 & 3)	Effective dose-equivalent in millisievert from external exposure of the whole body to gamma-radiation (Note 4).

NOTES:

1. The radiation protection category has been assigned on the basis of usual duties of members of the Work Unit.
2. This record includes data provided by U.K. authorities from currently available information related to exposures to ionising radiations, in which Australian citizens were involved.
3. The entry NIL indicates that the monitored exposure to radiation was below the minimum detectable by the method, namely, XXXXX millisievert. The entry NUL indicates that the record does not differentiate between monitored exposure below detectability and personal monitoring not being needed.
4. The effective dose-equivalent has been calculated from the monitor record by the Australian Radiation Laboratory to permit comparison with current radiation protection standards (see below).

CURRENT RADIATION PROTECTION STANDARDS

The standards, which currently apply in Australia, were recommended in 1980 by the National Health and Medical Research Council and conform with the internationally accepted recommendations.

Radiation Protection Category	Recommended Annual Limits in millisievert for the effective dose-equivalent for irradiation of the whole body
Radiation worker	50
Member of public	5

SUMMARY OF DOSE-EQUIVALENTS FROM EXTERNAL EXPOSURE OF THE WHOLE BODY TO BETA AND GAMMA RADIATION RECORDED DURING ENGAGEMENT IN THE PROGRAM OF BRITISH NUCLEAR WEAPONS TESTS IN AUSTRALIA

Name:

Employer:

Operation/location:

Work Unit:

Radiation protection category (Note 1):

Period of recorded radiation exposure	Personal monitor record in millisievert (Notes 2 & 3)		Dose-equivalents in millisievert from external exposure of the whole body ((Note 4)		
	gamma-radiation	beta-radiation	effective dose-equivalent	dose-equivalent to skin	dose-equivalent to lens of the eye

NOTES:

1. The radiation protection category has been assigned on the basis of usual duties of members of the Work Unit.
2. This record includes data provided by U.K. authorities from currently available information related to exposures to ionising radiations, in which Australian citizens were involved.
3. The entry NIL indicates that the monitored exposure to radiation was below the minimum detectable by the method, namely, XXXX millisievert. The entry NUL indicates that the record does not differentiate between monitored exposure below detectability and personal monitoring not being needed. The entry NON indicates that personal monitoring for non-penetrating radiation was not conducted, radiation protection control being exercised from personal monitoring of the penetrating component.
4. The dose-equivalents to organs and tissues have been calculated from the monitor record by the Australian Radiation Laboratory to permit comparison with current radiation protection standards (see below).

CURRENT RADIATION PROTECTION STANDARDS

The standards, which currently apply in Australia, were recommended in 1980 by the National Health and Medical Research Council and conform with the internationally accepted recommendations.

Radiation Protection Category	Recommended Annual Limits in millisievert		
	Effective dose-equivalent for whole body exposure	Dose-equivalent to skin	Dose-equivalent to lens of eye
Radiation worker	50	500	150
Member of public	5	50	15

CALCULATION TO CONVERT TISSUE ABSORBED DOSE AT FILM BADGE TO DOSE-EQUIVALENT TO LENS OF THE EYE

For gamma radiation, the factor is 0.88 for all energies and, hence, all fission product age.

For beta radiation, the problem is complicated by the heavy dependence on beta particle energy of most of the phenomena involved.

- (i) the calculation was made separately for ^{235}U fission - neutron fission and ^{239}Pu fission - neutron fission because they can be thought to be applicable and they give different β -radiation composition with age of the fission products.
- (ii) all fission product nuclides present at times $t=10$, 100 and 1000 days were included if they carried more than 1% of the activity at that time.
- (iii) all of the several energies of the β -radiation emitted from each nuclide were included where they exceeded 1% of the abundance in radioactive decay of the nuclide.
- (iv) it was assumed, as usual, that the fission products were deposited uniformly over an extended plane; the calculation proceeded by integration over the plane to give
 - I tissue absorbed dose at height $h = 1.00\text{m}$ (standard film badge height);
 - II tissue absorbed dose at $h = 1.63\text{m}$ (the height of the eyes in standard man) (a) at the interface between air and tissue of the eye and (b) at 3mm depth in the tissue (the lens of the eye);
 - III the ratio of I and II(b) gives the factor b by which B_s is to be multiplied.
- (v) full account was taken of absorption and scattering of the β particles in air before reaching $h = 1.00$, 1.63m and in the tissue of the eye at 1.63m .

	^{235}U		^{239}Pu	
t days	$\frac{\text{II(a)}}{\text{I}}$	$\frac{\text{II(b)}}{\text{I}}$	$\frac{\text{II(a)}}{\text{I}}$	$\frac{\text{II(b)}}{\text{I}}$
10	0.42	8.9×10^{-3}	0.42	9.2×10^{-3}
100	0.57	41 "	0.67	82 "
1000	0.75	101 "	0.78	119 "

For various reasons, the ^{239}Pu values of $\text{II(b)}/\text{I}$ are adopted for b , giving 0.01, 0.08 and 0.12 respectively.
